

Ww

What is the water cycle?

Page 2

The cycle water goes through
is part of God's design.

He keeps it going all the time
so water we can find.

As a liquid water flows
in rivers to the sea.

The oceans store the water
that all the earth does need.

Page 3

When the sun shines down on water
some will turn to gas,

Water vapor rising up
to form a cloudy mass.

The clouds move over land
when the wind does blow.

Droplets form and fall,
as rain or sleet or snow.

Page 4

Droplets run into the rivers

or soak down in the ground.

The water in the cycle

just keeps going round and round.

Water all around,

is what makes the earth of worth.

Without the water cycle

there'd be no life on earth.

Page 5

The water cycle functions,
the way it needs to be.

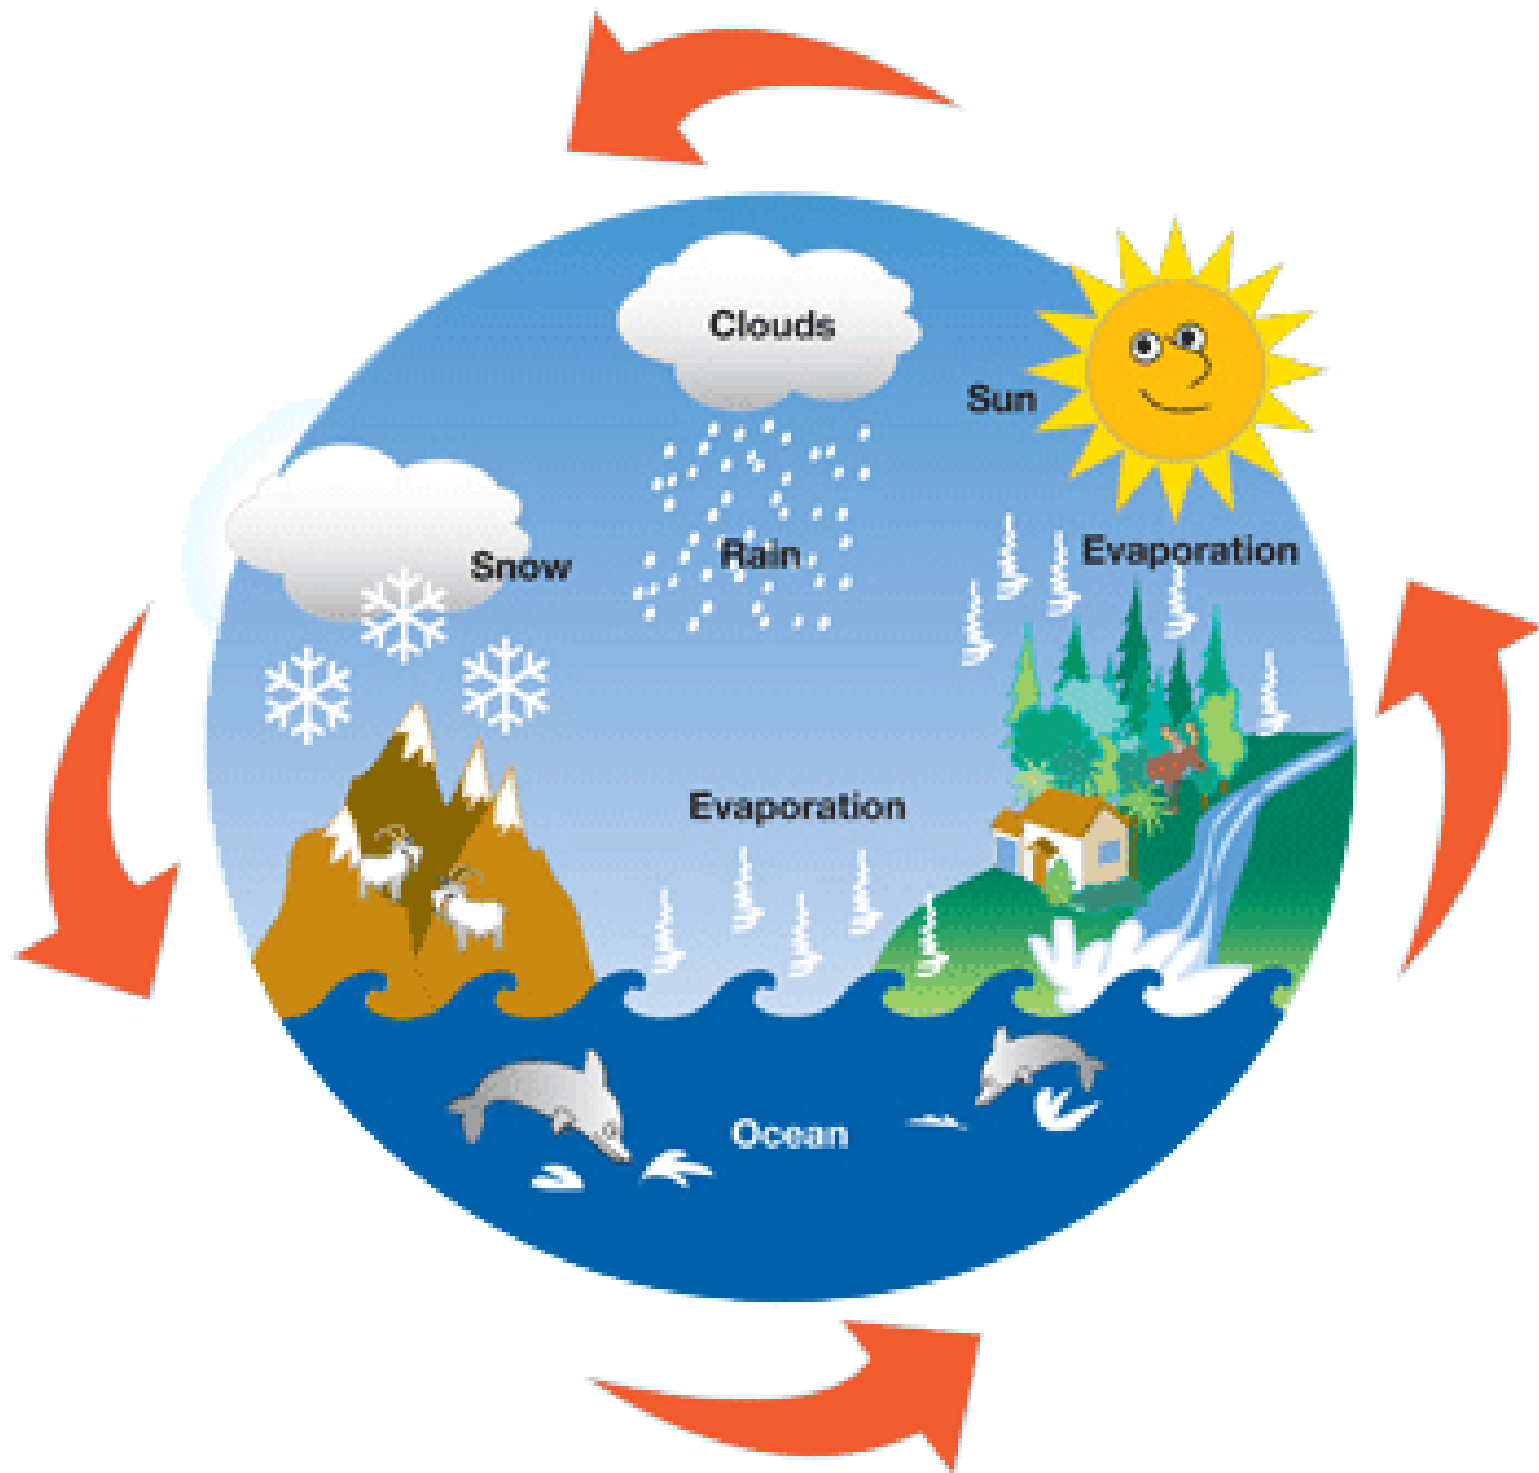

Water rising as a gas
when the sun shines on the sea.

Clouds they form from vapor
collected in a mass

Dropping rain upon the land
when over it they pass.

In rivers to the sea,
water will flow back

The water cycle God designed
to always stay on track.

Page 6

When God designed the earth,
he knew what life would need.

So air and water he brought forth
before a plant and seed.

It is good to know that God
thinks things clearly in his mind.

He provides for all our needs
because he's good and kind.

Page 1

God created water

And he made the earth a sphere.

Then on creation's third day,

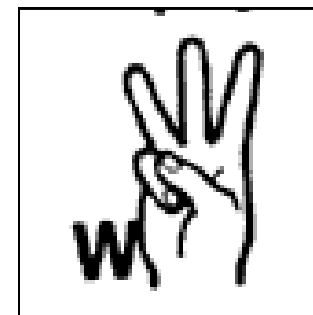

he made dry ground appear.

The water in the oceans,

takes up most earth's space.

The water's never used up,

it just moves from place to place.

What is the water cycle?

W—W

Make sign of "W"

Water

Make "W" sign with both hands and move in wave

Cycles all around

Move "W" in a circle.

W—W—Water

Same as above

From the sea

Move both hands in a wave motion

to air

Move open hands in opposite directions in front of face

to ground

Cross hands palms down in front. Move out in a flat line.
